

HOSTING A CITYWIDE EVENT IN YOUR HOME

If you are hosting a church event in your home, such as a mini-church, small group or Life Group, you are responsible for maintaining the highest hygiene practices and providing hand sanitizers for your visitors to use.

- You must not allow more than the number of people the size of your room can hold when taking into account the 4 sq.mt per person guideline.
- You must ensure that people are positioned at least 1.5 mts from each other at all times.
- We recommend that you do not serve food or drinks – at least when the threat of outbreak is still high.
- You will also be responsible to maintain a log or record book so that everybody who attends or visits your home can register their name and contact details. This is to help facilitate any tracing of a community outbreak of the coronavirus that may occur.

CLEANING AND PREPARING YOUR HOME

Cleaning during the COVID-19 pandemic

COVID-19 spreads through respiratory droplets produced when an infected person coughs or sneezes. A person can acquire the virus by touching a surface or object that has the virus on it and then touching their own mouth, nose or eyes.

- A key way you can protect visitors to your home from the risk of exposure to COVID-19 is by implementing appropriate cleaning and disinfecting measures for your home.
- A combination of cleaning and disinfection will be most effective in removing the COVID-19 virus.
- It is highly recommended that homes are cleaned regularly, and always **before and after** visitors have been there.
- Cleaning with detergent and water is sufficient.
- Once clean, surfaces can be disinfected.

Cleaning and disinfecting solutions

Cleaning and disinfecting are two different processes:

- Cleaning means to physically remove germs (bacteria and viruses), dirt and grime from surfaces using a detergent and water solution. A detergent is a surfactant that is designed to break up oil and grease with the use of water. Anything labelled as a detergent will work.
- Disinfecting means using chemicals to kill germs (bacteria and viruses) on surfaces. It's important to clean before disinfecting because dirt and grime can reduce the ability of disinfectants to kill germs. Disinfectants containing $\geq 70\%$ alcohol, quaternary ammonium compounds, chlorine bleach or oxygen bleach are suitable for use on hard surfaces (that is, surfaces where any spilt liquid pools, and does not soak in). These will be labelled as 'disinfectant' on the packaging.
